Norcold n611rt reset

WITHOUT FRIDGE DEFEND YOU ARE NOT PROTECTED Dometic & Norcold reliability and fire safety, can you live without it? The No Co Norcold page teaches how to reset all Norcold fridges when the No Co code flashes. The Fridge Defend by ARP Control prevents the return of this issue in most cases. No Co Code Can Indicate a Harmful or Dangerous Condition This page is to help you in two ways: 1) To reset the No Co error. 2) To prevent it from happening again. The No Co error can be a very serious problem. WHY? The No Co error is triggered when your fridge does not produce refrigerant for 2 hours. When your fridge does not produce refrigerant, this means the boiler is overheating. An overheating boiler not only warms the food in the fridge, it is what causes the fridge to fail. No Co INTENDED TO PREVENT FAILURE AND FIRE: Norcold's intentions were good, but the No Co is a Band-Aid, not a solution. Click on this link and get the Fridge Defend to keep your fridge trouble free, an engineered solution!. Step 1 First "no co" Fault Occurrence Step 2 Second "no co" Fault Occurrence N61, N81, N64, N84, N621, N821, N623, N823, N1095, N1200 Early Reset Procedure #1 N61, N81, N64.3, N84.3, N621, N821, N623, N823, N1095, N1210. Late Reset Procedure #2 N61, N81, N64, N84, N611, N811, N621, N821 Clearing Fault History Screen Following are the steps to reset your Norcold fridge if the No Co Norcold error message is appearing on your fridge control panel. In order to reset Norcold fridges when the No Co code flashes one has to take off the cover of the fridge controller. First "no co" Fault Occurrence The first time the "no co" fault code appears on the optical control assembly, it can be cleared by the user by turning the refrigerator OFF and then back ON. This gives the user the opportunity to check for problems that may have caused a "no co" code, such as obstructed ventilation. This fault code occurrence is then stored in the controls. If the refrigerator completes a full cooling cycle after the user turns it back on, this fault code occurrence will be cleared from the controls. Second "no co" Fault Occurrence If the refrigerator does not complete a full cooling cycle after the user turns the refrigerator back on and the "no co" fault displays, the control locks the heat sources and a "hard-wire" power board reset is required. The hard-wire reset of the power board must be performed by a service center according to Norcold if you are not qualified to perform this task. 1. Turn OFF the refrigerator. 2. Disconnect the following from power board: a. 12 VDC positive and negative wires. b. AC power cord. c. Gas valve solenoid coil wires. d. Spark/sense electrode assembly wires. 3. Remove the power board cover. 4. Reconnect a, b, c, & d disconnected in step 2. 5. Turn ON the refrigerator. 6. Locate Pin 15 on 16 pin connector (P1). Pin 15 is the empty socket to the right of the white/violet wire on the top row. See figure to the left. 7. Using an insulated jumper wire, short Pin 15 to the power board ground lug for 10 - 15 seconds. A click sound will indicate when the controls have reset. 8. Turn OFF the refrigerator. 9. Turn ON refrigerator. If "no co" code displays, repeat steps 7 - 9. If the code cleared proceed to step 10. 10. Turn OFF the refrigerator. 11. Disconnect a, b, c, & d. as directed in step 2. 12. Install the power board cover. 13. Reconnect the following to the power board: a. Spark/sense electrode assembly wire. b. Gas valve solenoid coil wires. c. AC power cord. d. 12 VDC positive and negative wires from the power board. 14. Place refrigerator in service. Please use the procedure steps above to open the control cover, also use the steps above with the exception of what is given below. Use a section of wire and insert it into the P2, pin-2 opening and hold into place. Pin-2 is the second pin from the right as shown in the photo. Ground the other end of the wire for a minimum of 10 seconds. Turn OFF the refrigerator. Restart, if the "no co" still flashes repeat the procedure. Please note that the photo is rotated, the top of the control is the upper left corner of the image. Thus, connector P2 is located at the upper left of the control board. Clearing Fault History Screen Press and hold the TEMP SET button on the fridge control panel. When 'Er' shows on the screen release the TEMP SET button. When 'CL' shows on the screen, wait five seconds and press and hold the TEMP SET button until 'Er' is shown on the screen again. Cycle the fridge off/on to see if the "no co" error is erased. Check Thermistor In a nutshell, the Fridge Defend by ARP will not allow the No Co fault to occur. This is because the No Co fault code is set when the fridge does not cool after turning on, the ARP detects this situation and usually intervenes before the No Co fault code can be set. If you do have the No Co turn on, this can be due to the temperature sensor (thermistor) in the fridge not sending a signal to the Norcold controller. Thus, please use this page with the Norcold Thermistor page. Posted on 16th Jul 2015 Is Your Norcold Refrigerator Doing One of the Following? N611, N811 front light flashing 5 times N400, N410, N412, N500, N510, N512, N621, N622, N821, N822 front display showing "n" N641, N642, NX641, NXA641, N841, N842, NX841, NXA841, 1200, 1210, 1211, 2117, 2118 front display showing "no co", one after the other For all of the codes above, the symptoms will be very simply that the refrigerator does not cool at all. Infact, you'll find if you check closely that there is power to your rear power board but no power getting to the AC or LP components. This is because the power board or circuit board is in something referred to as "lock-out mode". This happens when the refrigerator is requesting cool but for some reason or another is not sensing a temperature drop in the refrigerator compartment. The very first thing that needs to be done is to check for any possible cooling unit leak. This will either be in the form of a yellow powder/ residue beneath the cooling unit or by a faint, sometimes strong, smell of ammonia. If neither of those symptoms exist, it's time for you to reset the board. The next step in the process is for you to remove the power board cover from behind the refrigerator. There will be an access panel on the outside of your RV, directly behind where the refrigerator sits. From there you will have direct access to the power board. It is a black rectangular cover that will have wires going to it. There are a few screws holding this cover on. The next thing you'll need to do is jumper a pin terminal on the power board to ground (we recommend something around a 12 gauge jumper wire). The refrigerator must be on and showing the fault code before you jump the pin terminal to ground. Hold the jumper wire to the pin and ground for about 10 seconds or until you hear an audible click. If your power board was made pre 2006, you'll find a 16 pin plug connector at the bottom of the power board (two rows of 8). On this style board, you'll need to jump the second pin from the left hand side on the top row to ground. It will be an empty slot. If this board does not resemble the one you have on your refrigerator, you have the newer style Norcold board. On this style, you'll need to jumper the second pin from the right hand side to ground on the upper six pin terminal. This, too, will be an empty slot. After the board has been reset, it will run for three to four hours before it goes back into the lock-out mode it was in before. If it goes back into this code, we highly recommend contacting us for troubleshooting. Have one of our technicians walk you through a checklist of symptoms that can be diagnosed with little to zero knowledge of refrigerators. We offer this service in the form of Email support as well as phone support. We know RVers are Do-It-Yourselfers, so let us help you get that refrigerator back in working order! You can schedule a time slot at the link below: Norcold Technical Support The underlying issue could be any of the following: We hope this article has been helpful in getting your RV refrigerator working! Remember, resetting the board doesn't fix the problem that brought this code on. It simply resets the code so that you can further troubleshoot the underlying issue/s.
